

Direct to Film printing (DTF)

Direct to Film printing (DTF)...

What is DTF Printing?

DTF printing is an exciting new printing method that produces fantastic vibrancy & detail.

DTF printing is one of the most versatile printing techniques available, in that the setup costs are low, and the level of detail, vibrancy & gamut of colours that can be achieved is second to none.

The process of DTF printing involves printing your design onto a special PET film, using water-based inks & then adding a special powder adhesive. This design is then heat pressed onto the garment using a commercial heat press machine.

This decoration method is cost effective, durable and the designs are vibrant, detailed & will give your design the wow factor you're looking for.

To achieve the best possible print result, we suggest the following:

- Hi-Res art should be supplied.
- Always remember - the better the original art file, the better the end printed result.
- Images should ideally be a minimum of 300dpi where possible
- Files should be supplied to scale where possible
- PMS colours cannot be matched using this print method. Colours are converted to & printing via RGB.
